Long Term Goal

To conceive, develop and deploy instrument systems appropriate for specific scientific and Naval tasks.

Approach

Recent efforts have explored application of acoustic remote sensing techniques, including multibeam, side-scan and phased array Doppler sonars. These have been applied for the measurement of surface waves, nearshore currents and rips, internal waves, and large scale currents.

Tasks Completed

The phased array sector-scan sonars initially developed for Arctic and offshore work have been significantly upgraded. They have been modified to operate remotely, at the end of a cable up to 1 km long, and the data throughput has been upgraded to 20 m bytes/s, a factor of 60 improvement over the first generation system. Test equipment provided by this DURIP was instrumental in enabling this advance.

Results

Two sector scan sonars have been operating at DUCK, N.C., in support of the DUCK'97 Experiment. Dr. Jerome Smith of Scripps has obtained valuable data on shoaling waves and nearshore currents.

Impact

Dr. Smith has obtained a landmark set of observations including calm, storm and hurricane induced swell conditions. The ability to observe the inner shelf routinely during rough, as well as calm conditions is a breakthrough that could change the conduct of future research and monitoring programs. Test equipment provided by this DURIP were instrumental in developing this capability.

Relationship to Other Programs

The test equipment purchased so far has already had a significant impact on Dr. Smith's participation in Sandy DUCK, as well as group participation in the NSF Arctic program, SHEBA.
